RTNA4 - RTAA4

Industrial temperature switch with capillary

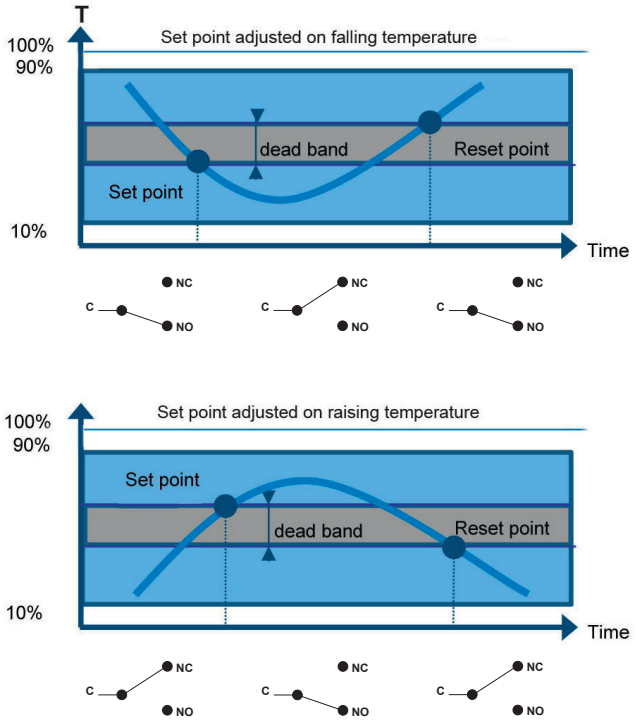
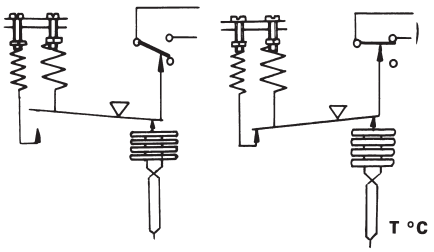
Principle



A vapour filled flexible sensing element actuates a microswitch by means of a lever. The set point is adjusted by means of a compressible spring installed in opposition.



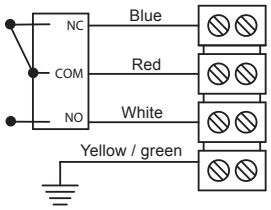
Set point and reset point must be between 10% and 90% of the selected scale.

Standard factory adjustment
Setpoint at 50% of the scale on falling temperature

Customer specific factory adjustment (option SETP)
The following specifications have to be given with the order:
- Setpoint value
- Adjustment on falling or raising temperature
- Dead band value (as needed) when using an adjustable dead band switch

Electrical connections

1 SPDT



2 SPDT

(*) For version with 2 microswitches lower values of the dead band must be multiplied x 1.5

[1] The value of the dead band is depending on the value of the set point.
This table contains the dead band values for set point adjustment at 10% and 90% of the selected scale. For adjustable dead band the lower value corresponds to the dead band spring totally released and the higher corresponds to the dead band spring fully tensed. For other set points the dead band value can be calculated by linear interpolation between the values at 10% and 90%.

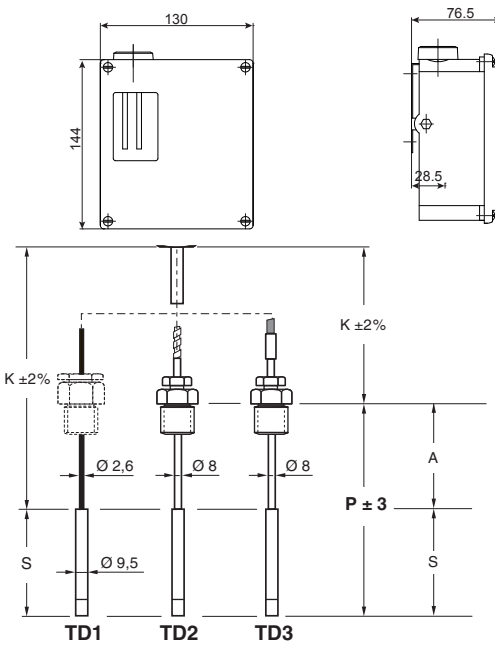
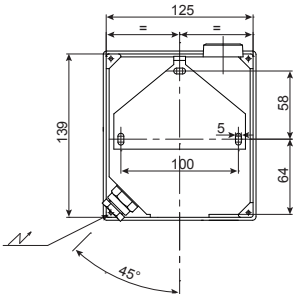
Dimensions (mm)





S = Bulb length (temperature sensitive part, see tables below)

A = Additional stem length
For versions TD2/3, A_{min} = 25 mm
For version TD1 there is no additional stem length (A=0).
The sliding connection is mounted on the capillary.

P = Immersion length (P = S + A)

P_{min} = Minimum immersion length (P_{min} = S + A_{min})

K = Capillary length
